

Symptoms which indicate that a heating system would benefit from a **CLEARFLOW** power flush

słudge

build-up

HOT WATER OUT **WATER IN Hot water** storage cylinder **Feed & expansion cistern COIL** Cold feed water inlet **Cold feed pipe** blocking up with corrosion or scale deposits air or hydrogen Circulator Zone valve abrasive rust particles in water Repeated pump failures / corrosion deposits in pump casing BOILE **Strange and unpleasant**

Some radiators are completely or partially cold

Radiators

with pinhole

perforation

and leakage

Radiators need frequent bleeding

noises from the boiler, particularly when working hardest

sludge or scale

Any of these symptoms could indicate that the system has circulation and flow problems as a result of internal corrosion, scale and sludge formation. Power flushing can remove undesirable corrosion residues and replace aggressive water quickly, restoring circulation and efficiency, and preventing future problems.
